

Jira Cloud CSV Migration Simulation Report

Evidence-based walkthrough of the CSV import performed in Jira Cloud

Purpose: document the practical steps completed to simulate migration-style import into Jira Cloud, including source CSV preparation, field mapping, value mapping, post-import validation, and Scrum board/backlog behavior.

1. Executive Summary

Area	Result / Evidence
Migration exercise type	CSV-based Jira Cloud import simulation
Source data	Mock Jira Data Center-style CSV export prepared in Google Sheets
Target	Jira Cloud space: CSV Migration Simulation
Imported items	8 work items created in Jira Cloud
Validated views	Summary, List, Backlog, Board, and individual issue detail
Important limitation	This is not a JCMA/Data Center migration. It is a CSV import simulation used as migration-readiness evidence.

I completed a CSV-based Jira Cloud migration simulation and validation exercise. It demonstrates source data preparation, field/value mapping, import execution, and post-import validation. It does not replace a JCMA-based Data Center to Cloud migration, which requires a licensed Jira Data Center source instance.

2. Process Overview

- Prepared mock source CSV export with Jira-style fields.
- Created/imported into a new Jira Cloud space called CSV Migration Simulation.
- Mapped CSV columns to Jira fields.
- Mapped CSV issue-type values to Jira work types.
- Proceeded without user migration because the CSV did not contain user columns.
- Validated imported work items in Summary, List, Backlog, Board, and issue-detail views.
- Explained the 8 vs 7 count difference: one issue was imported as Done and therefore was excluded from the Scrum backlog/active board.

3. Step-by-Step Evidence

1. Prepared the mock source export as a CSV file

A mock source export was prepared with Jira-style columns: Summary, Issue Type, Status, Priority, Description, and Labels. The dataset included 8 work items representing migration-related records such as ScriptRunner review, Xray assessment, user/group mapping, and validation checklist. This simulates the data preparation stage before importing work items into Jira Cloud.

Validation result: The CSV contained the required Summary column and realistic Jira values for issue type, status, priority, and labels.

1	Summary	Issue Type	Status	Priority	Description	Labels
2	Legacy login bug	Bug	To Do	High	Simulated issue exported from Jira Data Center	csv-migration
3	Payment workflow improvement	Story	In Progress	Medium	Simulated story from source Jira Data Center	csv-migration
4	API timeout investigation	Task	To Do	High	Simulated operational task from source Jira Data	csv-migration
5	ScriptRunner validator review	Task	To Do	Medium	Review source Data Center ScriptRunner validator	csv-migration
6	Xray test migration assessment	Task	To Do	Medium	Review Xray test cases and test execution migrati	csv-migration
7	User group mapping review	Task	Done	Medium	Validate users and groups before migration	csv-migration
8	Custom field rationalisation	Task	In Progress	High	Review duplicate and unused custom fields before	csv-migration
9	Post migration validation checklist	Task	To Do	High	Prepare validation checklist after Cloud import	csv-migration

Evidence: mock Jira Data Center issue export prepared in Google Sheets before CSV import.

2. Uploaded the CSV file into Jira Cloud import flow

The Jira Cloud import flow was opened and the prepared CSV file was uploaded. This step represents the import initiation stage where Jira receives the source data file before mapping fields and values.

Validation result: The file upload succeeded and Jira moved to the field-mapping stage.

The screenshot shows the Jira Cloud import flow interface. At the top, there is a progress bar with five steps: 'Set up space', 'Upload CSV' (highlighted in blue), 'Map fields', 'Map values', 'Move users', and 'Review details'. Below the progress bar, the 'Upload a CSV file' section is active. It contains instructions: 'Start by finding the Download or Export option on your app and export a CSV file. Structure the CSV to ensure the data is in the right format and upload it to begin.' Below the instructions, there is a file upload area showing a file named 'jira-cloud-csv-migration-simul...' with a green checkmark and the word 'Uploaded'. To the right of the file upload area, there is a diagram showing a CSV file icon being imported into a Jira icon. Below the file upload area, there are two expandable sections: 'CSV file settings' and 'Upload a configuration file (optional)'. At the bottom right, there are 'Back' and 'Next' buttons.

Evidence: CSV file uploaded successfully in Jira Cloud import experience.

3. Mapped CSV columns to Jira fields

The CSV columns were mapped to Jira fields: Summary to Summary, Issue Type to Issue Type, Status to Status, Priority to Priority, Description to Description, and Labels to Labels. This is the most important import configuration step because incorrect mapping would create missing or unusable issue data.

Validation result: All relevant CSV columns were included in the import and mapped to matching Jira fields

Evidence: CSV columns mapped to Jira fields.

4. Mapped issue type values to Jira work types

The issue type values from the CSV were mapped into Jira work types: Bug to Bug, Story to Story, and Task to Task. This ensured that imported records kept their intended work-item classification after import into Jira Cloud.

Validation result: Bug, Story, and Task values were mapped correctly.

Evidence: values in the Issue Type column mapped to Jira work types.

5. Created the CSV Migration Simulation space and confirmed import summary

A new Jira Cloud space named CSV Migration Simulation was created as the target import space. The summary view showed 8 created items, confirming that the CSV import created the expected number of work items in Jira Cloud.

Validation result: The target space was created and Jira reported 8 created work items.

Evidence: Jira Cloud space created and import summary showing 8 created work items.

6. Validated imported work items in List view

The List view was used as the primary validation view because it displays all imported work items, including items that are already Done. The List view confirmed 8 of 8 imported work items. The imported values for reporter, assignee, priority, status, and issue type were visible.

Validation result: All 8 imported work items were visible in List view.

Work	Assignee	Reporter	Priority	Status	Resolution	Created
☐ CMS-8 Post migration validation checklist	Unassigned	BK Bahar Khasanova	High	TO DO	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-7 Custom field rationalisation	Unassigned	BK Bahar Khasanova	High	IN PROGRESS	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-6 User group mapping review	Unassigned	BK Bahar Khasanova	Medium	DONE	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-5 Xray test migration assessment	Unassigned	BK Bahar Khasanova	Medium	TO DO	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-4 ScriptRunner validator review	Unassigned	BK Bahar Khasanova	Medium	TO DO	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-3 API timeout investigation	Unassigned	BK Bahar Khasanova	High	TO DO	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-2 Payment workflow improvement	Unassigned	BK Bahar Khasanova	Medium	IN PROGRESS	Unresolved	Jul 05, 2026, 3:25 P
☐ CMS-1 Legacy login bug	Unassigned	BK Bahar Khasanova	High	TO DO	Unresolved	Jul 05, 2026, 3:25 P

Evidence: List view showing 8 of 8 imported work items.

7. Validated backlog behavior in Scrum space

The Backlog view showed 7 work items rather than 8 because CMS-6 was imported directly with Done status. In a Scrum-style Jira space, completed work is not treated as backlog work. This is why List view is the correct place to confirm the full imported count.

Validation result: The apparent mismatch was explained by Jira Scrum behavior: one item was already Done and therefore absent from the backlog.

Evidence: Backlog view showing 7 active backlog items and one sprint section.

8. Started a sprint to make imported work visible on the board

The imported backlog items were added to a sprint so they could appear on the Scrum board. After starting the sprint, the board displayed work items under To Do and In Progress columns. CMS-6 remained Done and did not appear with the active sprint items.

Validation result: The board displayed imported active work items once they were included in a sprint.

Evidence: Board view after moving imported work into an active sprint.

9. Validated individual issue details after import

An individual imported issue was opened to validate that the detailed fields were imported correctly. The issue summary, description, priority, label, reporter, and assignee state were checked. This confirms that the import did not only create issue shells; it also preserved useful issue metadata.

Validation result: Issue detail validation confirmed that description, label, priority, reporter, and assignee state were visible as expected.

Evidence: imported issue detail page for CMS-4 ScriptRunner validator review.

4. User Migration Handling

During the CSV import, Jira displayed a message that there were no users in the CSV file. This was expected because the CSV did not include Assignee, Reporter, or user email columns. The import was continued without adding user information. As a result, imported issues were left unassigned, while the reporter was set to the importing Jira user where applicable.

For a real Jira Data Center to Jira Cloud migration, user and group migration should be handled separately through JCMA and Atlassian Cloud identity planning. The CSV exercise should therefore be positioned as import validation, not full user migration.

5. Validation Checklist

Validation Item	Result	Evidence / Notes
CSV source file prepared	Passed	Google Sheets source file screenshot
CSV uploaded to Jira Cloud	Passed	Upload CSV screenshot
Columns mapped to Jira fields	Passed	Map fields screenshot
Issue types mapped to work types	Passed	Map values screenshot
Target Jira Cloud space created	Passed	Summary view showing CSV Migration Simulation
Imported issue count validated	Passed	List view showing 8 of 8 items
Backlog behavior reviewed	Passed	7 backlog items; CMS-6 imported as Done

Board visibility validated	Passed	Sprint started and imported active items visible on board
Issue detail checked	Passed	CMS-4 detail view showing description, label, priority, reporter, assignee state
